

In the claims:

Please amend the claims as shown below:

- 5 1. (Original) A device for releasably mounting a bundle (30)
of bags on a wall (2), ~~said the device comprising:~~
~~a wall mounted suspension fitting (1), wherein one rear major~~
~~surface of the bag bundle is connected to a sheet (40) which~~
~~is parallel with said bundle and which is adapted for~~
10 ~~releasable co-action with the fitting (1), and wherein the~~
~~bags (32) in said bundle are releasably (36) connected to said~~
~~sheet at their respective opening regions, characterized in~~
~~that the sheet has an opening (45) midway of its width; in~~
~~that the fitting has an upwardly directed clip finger (11)~~
15 ~~which includes in an upper portion of its side facing towards~~
~~the wall (2) a projection (15) that can be received in the~~
~~opening (45) in the sheet (40); and in that the projection~~
~~(15) has two vertically separated oblique surfaces (16,17)~~
~~which are mutually convergent in a direction towards said wall~~
20 ~~for co-action with the upper and lower edges of the sheet~~
~~opening.~~
a sheet having an opening defined therein, the sheet having a
slot defined therein, the slot being disposed below the
opening;
25 a bundle of bags removably attached to the sheet, the bundle
of bags being parallel to the sheet;

a wall-mounted suspension fitting, the fitting having a first leg terminating at a curved bottom web, the curved bottom web extending to a second leg, the second leg having a free end portion, the free end portion being curved inwardly towards the first leg, the free end portion having a first converging surface and a second converging surface forming a nose; the curved bottom web being disposed in the slot of the sheet, the nose extending through the opening of the web and bearing against the first leg; and

10 the second leg being in contact with the bundle of bags and urging the bundle of bags away from the sheet.

2. (Currently amended) A device according to claim 1,

15 characterized in that the sheet (40) includes midway of its width a slot (43) which extends upwards wherein the slot extends upwardly from a from the lower edge (44) of the sheet and which has a horizontal width that is at least equally as large as the horizontal width of the projection (15) of the

20 clip-finger (15).

3. (Currently amended) A device according to claim 1, wherein the first leg is connectable to a wall.

characterized in that the lower end of the clip finger merges,

25 via a web, with an upwardly directed clip leg (10) that is connectable to said wall (2).

4. (Currently amended) A device according to claim 3,
~~characterized in that~~ wherein the fitting is comprised of a
springy, elastic strip-like element ~~whose width corresponds to~~
5 ~~the width of the sheet opening (45) and the sheet slot (43)~~
~~respectively.~~

5. (Previously presented) A device according to claim 3,
wherein the first leg has adhesive pads.
10 ~~characterized in that the clip leg (10) carries on its outer~~
~~surface discrete adhesive pads (20) for connection to the wall~~
~~(2).~~

6. (Currently amended) A device according to claim 4,
15 wherein the free end of the second leg is curved downwardly
towards the curved bottom web.
~~characterized in that the upper end portion of the clip finger~~
~~is curved downwardly and inwardly the clip leg (10) to form~~
~~the projection (15).~~
